

SOULAIRE CIRCULATION™

EFFECT ON HYPERTENSION

Soulaire Circulation has been shown to improve the reversal of high blood pressure. High blood pressure means that your arteries have become stiff and hard and have lost their elasticity and the bounce in the artery wall. The squeezing mechanism of Soulaire Circulation pumps the blood through the artery walls to:

- Helps secrete a gas called Nitric Oxide. Nitric Oxide vasodilates the arteries, meaning it opens up the arteries, widens the arteries so that blood can get through the arteries to the organs and to the heart
- Reduce inflammation occurs in the lining of the artery and clinical data has shown changes in plaque formation and inflammatory markers
- Reverses high blood pressure by increasing circulation and reversing arterial stiffness
- Improves function of the endothelial cells that line arterial walls
