EFFECT ON RENAL FAILURE

Before Soulaire

After Soulaire

Soulaire Circulation has been shown to improve the Renal Failure. Renal Failure is a condition in which the kidneys are functioning less than normal. When the kidney are not working well, waste and toxins build up in the body. The squeezing mechanism of Soulaire Circulation helps detox and filter the blood to remove waste from the kidneys. Soulaire circulation.

- Increases sheer stress of reversed blood flow and positively influences renal function by increasing oxygenated blood to the kidneys
- Aids in kidney regeneration improving levels of harmful toxins while also stimulating the production of adequate urine volume
- Helps Clients improve their kidney function even after just one session of Soulaire Circulation
- We have seen people who have been able to ward off dialysis or get off of dialysis and lower BUN and creatinine levels
